

bmsb - Strategy Walkthrough

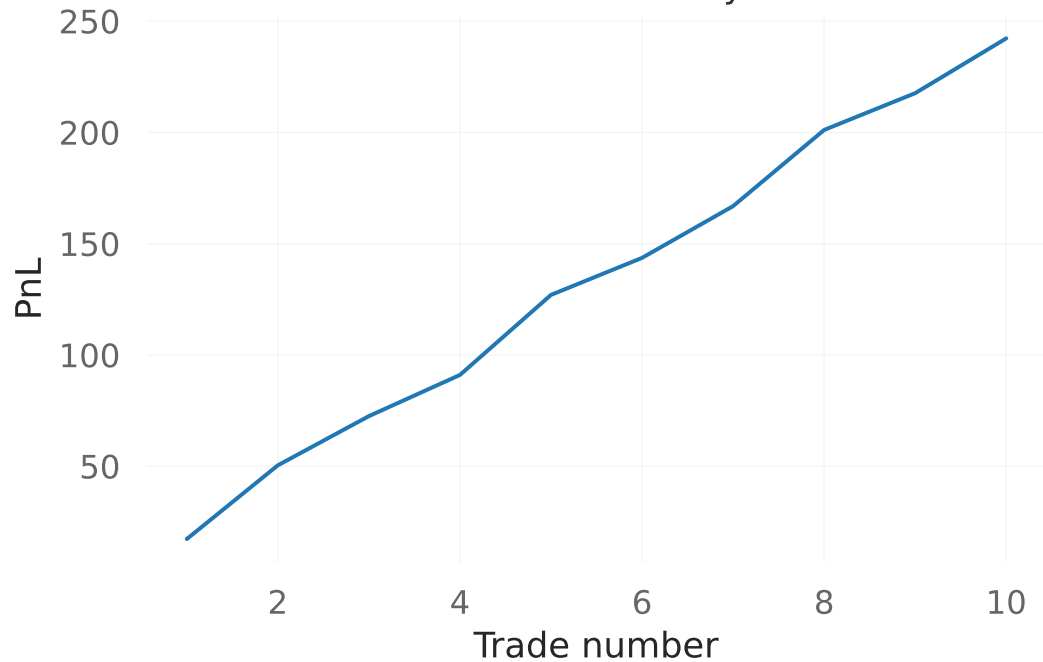

Strategy name bmsb Files reviewed - src/strategies/bmsb/strategy.py - src/strategies/bmsb/backtest_bmsb_v2.py Step-by-step execution flow 1) Backtest fetches OHLC early if no data. 2) compute_bmsb adds two lines: bmsb_sma and bmsb_ema, then bmsb = max(sma, bar. 3) compute_tensignal converts close > bmsb to +1 and close <= bmsb to -1, then rolling-s tensignal_window. 4) BacktesterV2 is initialized with execution, fee, SL/TP, pyramiding, and controls. 5) Optional trading_start_date gate skips bars before the chosen UTC timestamp. 6) is true and there is an open LONG, stop_price is trailed upward by trail_percent. 7) bt.on_bar each bar, then entry/exit logic is evaluated. 8) LONG is opened when buysignal and tensignal exits on bmsb crossunder. 9) Results are exported as stats, equity curve, optional report, and CSV. Parameters and defaults - Core indicators: sma_period=20, ema_period=21, tensignal_window=10. Trailing: trail_percent=0.05, use_tp_sl=True. - Execution and cost: initial_balance=1000.0, commission_pct=0.001, slippage_pct=0.001. - Position controls: position_mode="all_in", trade_position_pct=None, pyramiding=1. - Direction and risk: allow_short=False, stop_loss_pct=None, take_profit_pct=None. Indicators/calculations - bmsb_sma = rolling mean of close over sma_period. bmsb_ema = EMA(close, ema_period). - bmsb = max(bmsb_sma, bmsb_ema). - tensignal = rolling sum of tensignal over tensignal_window. Entry conditions - LONG when close > bmsb and tensignal >= 1. Exit conditions - EXIT long when previous close >= previous bmsb and current close < current bmsb (crossunder). position management (SL/TP/ATR/trailing/pyramiding/position sizing) - No ATR-based SL/TP logic in runner. - Optional trailing stop updates only for open LONG positions. - stop_loss_pct and take_profit_pct are passed to BacktesterV2 but default to None. - Pyramiding available via BacktesterV2 (default 1). - Position sizing by BacktesterV2 (all_in by default; optional position_pct). 0.001 (trades, stats, plots, reports) - clean_stats from bt.stats(). - Equity curve PNG under static/backtests/bmsb/<run_id>/. - Trades CSV including bmsb metadata fields. - QuantStats report generate_report is true. Known ambiguities or inconsistencies in the code - Parameter use_tp_sl only the custom trailing-stop block; it does not toggle all stop/take-profit logic inside BacktesterV2. CSV metadata writes SMA/EMA periods into columns named ema_fast/ema_slow, which is naming mismatch for this strategy.

bmsb - Trade summary

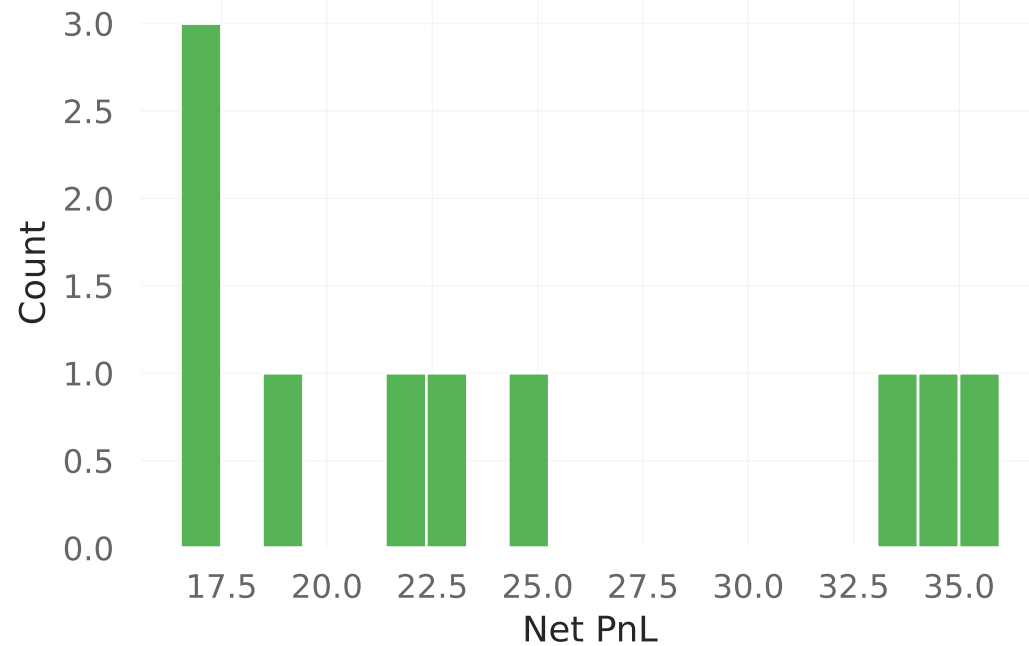

Trades: 10 Total Net PnL: 242.30 Average Net PnL per trade: 24.23 Win rate: 100.00% First trigger: 2023-01-01 10:00:00 Last trigger: 2023-01-01 10:00:00
